

CALVIN NGUYEN

714-487-8042 calvindnguyen714@gmail.com [LinkedIn](#) [GitHub](#) [Portfolio](#)

SKILLS Kotlin, Java, Git, SQL, Ruby / Rails, HTML5, CSS3, jQuery, JavaScript, React.js, Redux, MongoDB, Express, Node.js

EXPERIENCE

Backend Engineer

Block, Feb 2022 – June 2026

- Contributed to migrating a high-traffic backend service to Kotlin on Kubernetes (AWS), reducing latency by 80%+ and enabling scalable, event-driven architecture via Kafka
- Established service-level objectives (SLOs) and implemented end-to-end observability using Datadog, enabling proactive incident detection and zero-downtime rollouts
- Partnered with platform teams and cross-functional stakeholders to define requirements, scope deliverables, and execute a phased rollout plan
- Collaborated with product, design, and mobile engineering teams to deliver server-driven UI components; authored design docs and led Amplitude experiment planning to enable A/B testing for features reaching 10M+ users

Software Engineer, Intern

Afterpay, Nov 2021 – Feb 2022

- Participated in weekly engineering planning and daily standup with a multi-functional team to bring a product to market
- Coordinated with 3rd party vendors to integrate their RESTful endpoints in our Springboot backend with unit/integration testing
- Setup logs and monitoring in Sumo Logic to gain insight and identify user pain points or system failures in our product signup flow

EDUCATION

University California @ Riverside - BS - Computer Engineering

App Academy - Immersive software development course with focus on full stack web development

PROJECTS

Ball-popcalypse | (Javascript, HTML5 Canvas)

[Live Site](#) | [GitHub](#)

A top-down zombie-horde shooter game requiring quick reactions to avoid being overwhelmed

- Incorporated Object Oriented Programming principles and HTML5 Canvas animation loop to increase code reusability for entity generation, updating and rendering logic
- Emphasized physical interactions through collision detection of hundreds of entities that factor in velocity, acceleration, weight, and knockback vector calculations, allowing for dynamic gameplay
- Due to physics heavy-nature of the game, scale gameplay speed and enemy spawn rate relative to loss in game frame rate to help avoid poor gameplay experience

Feedr | (Ruby, Rails, React, Redux, Postgres)

[GitHub](#)

A full-stack clone of Feedly, an RSS/Atom Reader web application

- Implemented User Auth using Ruby on Rails backend, allowing users to securely manage and read their feeds
- Employed XML parser to read RSS/Atom Feed on user's request and on a scheduled task that populates database with only new articles to avoid duplicate articles and faster fetching
- Leveraged React and Redux to draw navigation components and update only the main frontend components to increase application responsiveness and avoid interrupting the user experience
